Experiments

Telegram Allowlist Hardening

Date: 2026-01-05
Status: Complete
PR: #216

Summary

Telegram allowlists now accept `telegram:` and `tg:` prefixes case-insensitively, and tolerate accidental whitespace. This aligns inbound allowlist checks with outbound send normalization.

What changed

Prefixes `telegram:` and `tg:` are treated the same (case-insensitive).

Allowlist entries are trimmed; empty entries are ignored.

Examples

All of these are accepted for the same ID:

```
telegram:123456

TG:123456

tg:123456
```

Why it matters

Copy/paste from logs or chat IDs often includes prefixes and whitespace. Normalizing avoids false negatives when deciding whether to respond in DMs or groups.
